September 13, 2021

Dear Stuyvesant Math Student,

All students enrolled in geometry, algebra 2, pre-calculus, AP Calculus AB, and AP Calculus BC will complete an exam based on the content of the DeltaMath summer assignment. The exam will be administered online using DeltaMath. The exam will open at 8:00 a.m. on Wednesday, September 22nd and close at 8:00 a.m. on Friday, September 24th. The exam is designed to take you 45 minutes to complete, but we have given you 2 hours to allow for any technical issues you may experience. ***Please note that you will need to allot the entire time to take the exam. You may not save your work and return to it at a later time; it must all be completed at once.*** If you have extended time, the program will automatically give you the extension to which are entitled.

You will access the exam using the same log-in used to complete the summer assignment. Please ensure that you select the assessment that corresponds to the course in which you are currently enrolled. For example, if you are currently a student in geometry, you will complete the "Geometry Summer Assignment Exam." You will not receive credit for taking an exam for any other course.

You will not see the exam listed as an assignment before or after the testing window. To begin the exam, log in to DeltaMath using the same User Name and Password you used for the summer assignment. During the testing window, the assessment will appear under the "Upcoming Assignments" heading.

While taking the exam, please be mindful of the following guidelines and expectations:

1. To save your answer, select the "Submit Answer" button after each question. To unsubmit your answer, select the red "unsubmit answer" link. Please note that if you move to another question without submitting an answer, DeltaMath will not save anything you've entered for that question.
2. Unless you are specifically told to round your answer, DeltaMath expects you to express your answer as an exact value. If you include a decimal answer instead of the exact value, your answer will be marked wrong. For example, if you use your calculator to compute $\frac{\sqrt{3}}{2}$ and express your answer as a decimal without specifically being told how to round, it will be marked incorrect.
3. If you are told to express your answer as a rounded answer, DeltaMath will only mark your answer correct if it is rounded to the correct decimal place. For example, if the correct answer rounded to the nearest hundredth is meant to be 3.29 and you enter 3.294 or 3.3, it will be marked incorrect.
4. If the question asks you to express your answer as an equation, the answer will be marked incorrect if your answer is an expression. For example, if the correct answer is meant to be the equation $y = 2x + 1$ and you enter $2x + 1$ as your answer, it will be marked incorrect.
5. If you have any questions or concerns while taking the exam, please email your teacher immediately.
6. You may use your own graphing calculator or the calculator that is embedded in the program.
7. As this is an assessment, the [Stuyvesant High School Academic Integrity Policy](#) will apply.

Good luck!

Sincerely,
Eric Smith
Assistant Principal of Mathematics & Computer Science
